Q1/Not recommended to use tables for HTML layout, why?

HTML tables were originally intended to be used for presenting tabular data, not for layout.

Tables are intended for displaying tabular data, such as lists of items or data with rows and columns. Using tables for layout doesn't reflect the semantic structure of a web page, making it less accessible for assistive technologies and search engines Tables used for layout can be challenging for individuals with disabilities who rely on screen readers or other assistive technologies. These technologies may struggle to interpret and convey the content correctly when tables are misused for layout.
